EgoQuant: execution evidence (index)

2026 Shenzhen FinTechathon, WeBank International Track, Topic B. Assembled 20 October 2026 by the team. Every file below is either a dated log of the running system, a log of invented ("simulated") investors going through the real code, or a committed result file from the repository at the version tagged `submission-20oct`*. Invented investors are always labelled as such; prices are a saved snapshot of real prices (Yahoo Finance, to 16 October 2026, cited in the documents and accepted for the competition only).*

A. Operation logs of the live system (sandbox: the public deployment, read-only requests)

File	What it is
`deploy_check_live_20oct_1604.txt`	The full read-only deploy check against the live API (`python eval/deploy_check.py <url>`), run 20 Oct 11:58 UTC = 15:58 Dubai (the file name says 1604): 71 checks, 71 PASS, 0 FAIL (status, the Python version 3.14.4, price mode, security headers, CORS, the Risk Game on three investors, portfolio builds against the committed demo pack, trade checks, the what-if refusal without a token). Builds took 4.9 to 5.4 s on saved prices, trade checks 3.5 to 4.3 s. The library versions are in the status file next to it.
`data_status_live_20oct_1604.json`	`GET /data/status` of the live API at the same time: price mode `snapshot` , portfolio method `v1` , Python 3.14.4, pandas 3.0.6, numpy 2.5.4, scipy 1.18.1, Risk Game weight 1/3, news worker state. No secret is shown (a test guarantees it).
`deploy_check_live_new_service_59960_20oct_1744.txt` , `data_status_live_new_service_59960_20oct_1744.json`	**20 Oct 17:44: the live API moved to a new Railway service of the same code line**, https://web-production-59960.up.railway.app (the previous service, `web-production-ee5cc` , stays up until the switch is verified; the earlier checks in this folder ran against it). The full deploy check on the new service: 71 PASS, 0 FAIL, 0 WARN; snapshot price mode, Python 3.14.4, seal v2 enabled, CORS for the website's origin.
`deploy_check_live_after_final_deploy.txt` , `data_status_live_after_final_deploy.json`	The same two files re-run at 16:12 Dubai after the deployment of the final document bundle: 71 PASS, 0 FAIL, builds 5.5 to 6.4 s; the status shows the news worker freshly restarted.

B. Simulated-account operation logs (invented investors through the real code, offline, saved real prices, no AI call)

File	What it is
`fourteen_investors_20oct_console.log`	Console log of `eval/twelve_users.py` (the script kept its name from when it had twelve investors): 14 invented investors, 30 portfolio builds, 26 trade checks, 14 what-ifs, 31 wrong requests; **0 rule failures**; the log ends with two automatic findings (T01, T02, severity C: two 422 sentences for requests that no screen of the website sends) (the category equals the lower of capacity and the blend on every route; every product allowed for the category and platform; weights sum to 1; caps hold; excluded industries never held). Run 20 Oct about 14:30 on commit `6e217ce` , whose `egoquant/` code is identical to the tagged version (later commits changed documents only).

File	What it is
`fourteen_investors_20oct_data.json`	Every request and answer of that run (profiles, portfolios, trade checks, what-ifs, error sentences).
`fourteen_investors_20oct_texts.md`	Every investor-facing sentence of that run, as read in the fourteen-stranger check (`docs/judges/03_METHODS_AND_MODELS.md` section 6.3).
`test_run_by_area_20oct.txt`	The area-by-area run of the offline test suite on 20 Oct: 3,540 selected tests in 141 files; 3,538 passed, 1 failed (a known timing test of the news page), 1 skipped. Fourteen tests added after that run (13 for the chat's trade tool with one size field, 1 for the downloaded report making no request when opened) ran green; the tagged version selects 3,554. The total is a composite: every area except `agent_a`, `agent_a/v2` and `anchoring` ran on the deployed backend `8f21177`, those three on the final candidate (same product code) (`docs/judges/04_TESTING_AND_EVIDENCE.md` section 1).
`committed/demo_numbers_v1.json`	The demo pack: three invented investors through the real routes (category, limits, portfolio, goal chance, trade verdicts); the numbers quoted in `docs/DEMO_SCRIPT.md` and the video script; the deploy check compares the live service against it.

C. On-chain evidence (real transactions on the Ethereum Sepolia test network)

File	What it is
`committed/ON_CHAIN_EVIDENCE.md`	Every real seal with its transaction hash and Etherscan link: five seals of real engine output for invented investors (A1 to A5), five hand-written test seals (B1 to B5), the Verify page's demo report (block 11,951,549) and the live signed-in seal of 20 Oct (block 11,954,258), with the tampered-copy results. Sealing address `0x3c9E28032A834F958BaBE168aa9AcC116D2c9ddC`.
`committed/sepolia_snapshot.json`	A read-only snapshot of the real Sepolia transactions that `tests/anchoring/test_committed_proofs.py` verifies on every test run.
`b_onchain/` (Aslan, 20 Oct)	The on-chain evidence pack: `README.md` (what a seal is, what is real and what is invented), `transactions.csv` (the 12 real Sepolia seals with block, hash and Etherscan link), `verify_snapshot.md` (the live Verify page read on 20 Oct), `proofs/` (the committed proof files, their tampered copies, and the demo sealed report), `screenshots/` (16 screens of the live seal flow: build, news, confirm with consent, sealed, download, Verify unchanged, edited copy does not match, seal file, My seals, Etherscan input data starting with EGOQ1).
Live	https://fintechaton-frontend.vercel.app/verify : "Use the demo report" checks a real sealed report against the live chain; "Try a tampered copy" shows the failure.

D. AI red-teams against the real model (OpenAI, 18 and 19 October; raw results)

File	Result
`committed/chat_redteam_20261018_162537.jsonl`	advisor chat prompt v2: 19 of 19

File	Result
`committed/chat_redteam_20261018_184112.jsonl`	prompt v3: 19 of 19
`committed/chat_redteam_20261018_200514.jsonl`	prompt v4: 21 of 21
`committed/chat_redteam_20261019_034229.jsonl`	prompt v5: 24 of 24
`committed/trade_explain_redteam_20261019_033606.jsonl`	trade explanation v1: 22 of 24 (both failures one Chinese-language case, fixed in v2 by answering in English only)
`committed/trade_explain_redteam_20261019_033814.jsonl`	v2: 24 of 24
`committed/trade_explain_redteam_20261019_170015.jsonl`	v3: 24 of 24
`committed/trade_explain_redteam_20261019_173418.jsonl`, `..._173917.jsonl`	v3: 51 of 51, twice
`committed/trade_explain_redteam_20261020_162406.jsonl`	20 Oct, trade explanation v4 (the final prompt): 51 of 51 (17 cases x 3 verdicts; 50 replies written by the model, 1 by the template)
`committed/chat_redteam_20261020_161517.jsonl`, `..._163303.jsonl`	20 Oct, advisor chat v10 (C3 demo investor, then a C4 variant): 34 of 42 each; all 24 non-trade cases passed; 8 of 18 trade cases failed safely for one cause (the model filled both size fields of the trade tool, so the server refused the call and no verdict was given): the defect fixed the same hour as advisor-v11 (one size field)
`committed/chat_redteam_20261020_163812.jsonl`	20 Oct, advisor-v11, the 18 trade cases: 17 of 18 (the miss is a false positive of the harness's keyword check on a correct reply)
`committed/chat_redteam_20261020_164237.jsonl`	20 Oct, advisor-v11, the full 42 cases: **41 of 42** (24 of 24 non-trade, 17 of 18 trade; the same false positive)
The red-team is the team's own 42-case suite run against the live model, not an external audit.	

E. Method evidence (committed results)

File	What it is
`committed/regime_v2_summary.md`	The calibration backtest of the goal simulation (rolling start dates, models refitted on earlier data only): Brier score better than the plain bootstrap by 0.007 at five years and 0.011 at ten years; on later dates within the noise; realised against simulated shares per portfolio type.
`committed/memory_horizon.md`	Peak memory of a goal request by horizon (why the build gate exists).
`committed/SUPABASE_LOG.md`	The database owner's log: migrations applied, Row-Level Security proofs run on the real project (PASS), the anonymous-read probe (refused on all 12 tables), auth settings.

F. Where the rest is

The full test suite, the stress tools and the deploy check are in the backend repository (`tests/`, `eval/`, `eval/stress/`); how to re-run everything: `docs/judges/04_TESTING_AND_EVIDENCE.md` section 2.

Hypothetical, based on past data; not a forecast, not a recommendation. EgoQuant places no orders and moves no money.
